

People involved: Françoise Genova, Agata Trovato, Markus Nullmeier

Summary:

- Françoise Genova showed the main features of VizieR
- Discussion on how to include the BBH O2 Catalog in VizieR:
  - Some peculiar features of the GW can be already inserted (e.g. waveform as time series)
  - Parameters like masses, spins, SNR, etc. can be inserted in a "standard" way (standard for VizieR) with a description explaining them
  - The position is the weakest point. At the moment a fits file could be produced from the MOC created by Giuseppe Greco. In the future, the VizieR experts plan to add the possibility to include the MOC directly as VizieR entry. This could happen at the beginning of next year but it's not obvious to foreseen when.

Actions to do:

Once will be clarified what there will be exactly in the BBH O2 catalog, Agata will contact Françoise and the people responsible for VizieR
